

# Java BE developer test

In this test you will need to do the following steps:

- Create a Spring MVC app with Maven
- Create a controller that can be reached using the path /getComments and HTTP GET method
- Create a service class that fetch comments from the following API end point (<https://my-json-server.typicode.com/typicode/demo/comments>) and convert them into an array of objects (Create a model class for that object)
- Create a service class that will write that last model class in a comma seperated format to a file on the server
- Controller should use these services two services to achive the full cycle from reading the data from APIs to writing the data to the file
- Make unit tests for these two service classes
- Upload your code to github repositorty using git command
